USD1

Pillar 5 Marketing Execution Playbook

Narrative Control & Developer Mindshare

Prepared for: Marketing Team
Aligned with: USD1 Strategic Dominance Roadmap V2
World Liberty Financial (WLFI) | Confidential | March 2026

How to use this document
This playbook translates Pillar 5 of the Strategic Dominance Roadmap into a detailed execution guide for the Marketing team. It retains full alignment with the company-wide strategy while adding the specificity needed to plan, assign, and execute every initiative. Where tasks require input or build support from Engineering, the document clearly flags those dependencies so Marketing can coordinate appropriately in advance.

1 Why Pillar 5 Is the Decisive Battleground

The stablecoin market is not decided by technology alone — it is decided by which stablecoin's story becomes the operating assumption that developers, institutions, and protocols reach for by default. Circle owns the 'regulated dollar stablecoin' story. Tether owns the 'everywhere liquidity' story. Ethena owns the 'yield' story.

USD1 has a narrow, time-limited window to own the defining story of the next era: the agentic economy's financial primitive. That window exists because the category is not yet defined. Agentic payment infrastructure is being written right now — in GitHub repositories, agent skill marketplaces, and standards body working groups. The organizations that plant their flag in those spaces before Circle's Arc mainnet achieves critical developer adoption will own the category.

The Core Strategic Insight
Circle's CEO devoted 40% of his most recent earnings call to agentic payments — specifically naming X402, ERC-8004, and MCP server integrations as the emerging standard infrastructure. He is building toward this. USD1's advantage is not that Circle is asleep. It is that USD1 has something Circle cannot buy: a structural relationship with G42 — the world's most influential AI infrastructure investor — at the exact moment that infrastructure is being deployed. That advantage expires the moment Circle's Arc mainnet launches and reaches critical developer adoption.

Pillar 5 is the mechanism by which every technical and infrastructure advantage across all other Pillars becomes legible to the market. Without Narrative Control and Developer Mindshare, USD1's real-time proof of reserves is just an API. Its EIP-3009 implementation is just a spec. Its G42 relationships are just unreported business development. Pillar 5 converts infrastructure into market position — and market position into default adoption.

2 The Core Narrative Framework

Every piece of content, every announcement, every technical specification produced by the Marketing team should reinforce one idea and one idea only:

> **USD1 is not a stablecoin.**
> *It is the economic operating layer for autonomous AI systems — the first dollar-denominated asset designed from the ground up for non-human transactors, distributed through the world's most influential AI infrastructure network.*

Shawn suggestions:

USD1 is not a stablecoin.

It is the economic operating layer for autonomous AI systems — the first dollar-denominated asset designed from the ground up for non-human transactors **and the humans who deploy them**, distributed through the world's most influential AI infrastructure network.

Note: includes the retails in our narrative.

This is a deliberate repositioning, not a description. It reframes every competitive comparison before it can be made:

- USDC is built for humans who want to move dollars digitally. USD1 is built for agents that need to settle economic transactions autonomously.
- USDT is built for liquidity. USD1 is built for programmability.
- Ethena is built for yield. USD1 is built for economic infrastructure.

2.1 Narrative Hierarchy

The following hierarchy defines how messaging should ladder from the highest strategic framing down to specific technical claims. Marketing should audit all content against this structure before publication.

Level	Message
Primary (All audiences)	USD1 is the financial primitive of the agentic economy.
Developer audience	USD1 is the only stablecoin designed for non-human transactors. Build once, deploy everywhere agents settle.
Institutional audience	USD1 is machine-readable money — real-time proof of reserves, EIP-3009 gasless settlement, purpose-built for agentic infrastructure.
Sovereign / Policy audience	The first GENIUS-compliant stablecoin purpose-built for AI economic activity. Endorsed by the world's largest AI infrastructure investor.
General market	The fastest-growing stablecoin in history, built for what money does next.

Addition Narrative:

1. **Compliance-as-differentiator narrative.** From the March 11 eng call: WLFI's compliance infrastructure (GENIUS Act, OCC filing) is a competitive weapon, not just a checkbox. Circle talks about compliance. We can own the story that compliance enables agentic payments at institutional scale because regulators will shut down non-compliant alternatives. This angle was missing from the original playbook.
    a. As per call with ENG team - USD1 x402 Facilitator can potentially equip with these - Every USD1 payment flowing through our facilitator automatically gets:
        i. Sanctions screening (OFAC list check on both sender and receiver)
        ii. KYA (Know Your Agent) — check if the agent is registered on ERC-8004
        iii. Trust score check — is this agent's ERC-8126 reputation above threshold?
        iv. Transaction pattern analysis — is this agent behaving normally?
        v. GENIUS Act metadata attachment — every transaction carries the compliance data regulators want
    b. "USD1 is the only one where compliance is the product. Machine-readable reserves aren't a feature. They're what regulators will require of every stablecoin touching autonomous financial systems. We're not adapting to regulation. We built for it."

2.2 Claims That Must Be Substantiated

The following factual claims are cleared for use in marketing materials. Each requires the indicated supporting proof point to be referenced in materials where the claim appears.

Claim	Required Proof Point
'First stablecoin whose reserves are machine-readable'	Real-time proof of reserves API — link to public endpoint in every instance
'Designed for non-human transactors'	EIP-3009 gasless meta-transactions, headless wallet creation, agent SDK
'Fastest-growing stablecoin in history'	$4.5B in under 12 months vs. Circle's 3.5 years to $2B — cite both figures
'Distributed through world's most influential AI infrastructure'	G42 investor relationship — deploy only after G42 communications are approved
'GENIUS-compliant'	OCC Limited Trust Charter filing — note conditional approval expected May 2026

The Knowledge Gap G42 - While G42 is one of the crown jewels of our roadmap, the reality is that most of our everyday audience—especially retail users—has no idea what G42 is or why it actually matters.

The Fix - Educational Campaign for the Masses - stop burying this in institutional pitch decks and create a dedicated educational content series designed for the general public. **Narrative to drive in content**:

- The Microsoft Backing: G42 isn't just a startup; it's a massive AI infrastructure company strategically backed by Microsoft.
- Global Reach: They manage sovereign-level AI compute deployments across the Middle East and Southeast Asia.
- The Hardware Moat: They have direct access to NVIDIA chip allocations.
- Strategic Influence: They hold two board seats at WLFI.

Marketing will create deep-dive articles in English, paired with a highly engaging X. Amplify by XDO.

2.3 Language Standards

Consistency in language is a signal of strategic clarity. The following standards apply to all external-facing USD1 content.

Always Say	Never Say
Non-human transactors / autonomous agents	AI wallets / crypto bots
Financial primitive of the agentic economy	AI-friendly stablecoin
Machine-readable reserves	Real-time transparency
Economic operating layer	Payment solution
Agentic payment infrastructure	Smart contract payments
USD1 is deployed on [chain]	USD1 supports [chain]

3 Developer Content & Education (5.2)

Developer content is the highest-leverage distribution channel available to USD1 at this moment. Circle's developer documentation is its primary competitive moat. It converted developer attention into protocol defaults before any regulator, institution, or enterprise made a decision. USD1 must execute the same playbook, faster, with a clearer positioning thesis.

Each initiative below is classified by ownership, timeline, and whether Engineering team support is required. Tasks marked with an Engineering Dependency require Marketing to initiate a formal coordination request with Engineering before work begins — do not begin execution without engineering input where flagged.

3.1 'Building Agentic Businesses with USD1' Developer Guide

Objective

Create a comprehensive, code-heavy developer guide that directly competes with Circle's developer documentation — specifically framed around building agentic businesses, not just transacting.

What It Must Cover

- Overview of USD1 as the agentic payment primitive — the framing, not just the features
- Quickstart: spinning up a headless wallet and making the first agent payment in under 15 minutes
- Full API reference formatted for LLM context windows, not just human developers
- Integration guides for each major agentic coding environment: OpenClaw, Claude Code, Cursor, Codex, Windsurf
- Three worked examples at increasing complexity: agent-to-agent payment, API fee settlement, autonomous payroll
- Error handling, edge cases, and production deployment checklist
- Comparison table: 'USD1 vs. USDC for agentic developers' — factual, not marketing

⚙ **ENGINEERING DEPENDENCY** — Action Required from Engineering Team

Marketing requires Engineering support to produce accurate, production-quality code examples. Do not publish code that has not been reviewed and validated by Engineering. The guide should be co-authored: Marketing owns structure, narrative, and framing; Engineering owns all code samples, API references, and technical accuracy.

- Provide reviewed, working code examples for all three agent workflow types (agent-to-agent, API fee settlement, autonomous payroll)
- Validate the headless wallet creation quickstart against the live SDK before publication
- Confirm which agentic coding environments are supported at launch — Marketing must not claim support for environments not yet integrated
- Provide the API reference in machine-readable format (OpenAPI spec or equivalent) for Marketing to format into the guide
- Review the USDC comparison table for technical accuracy before it is published externally

Distribution

- Primary: developer.wlfi.com (or equivalent dedicated developer portal)
- Mirror: GitHub repository with the guide as the README
- Announce via developer newsletters, X/Twitter developer accounts, and Farcaster
- Submit to agent skill marketplaces as the canonical USD1 integration reference

Success Metrics

- 1,000 unique developer sessions within 30 days of launch
- Guide cited in at least 5 external developer tutorials or integration posts within 60 days
- Time-to-first-integration tracked via SDK analytics — target: under 20 minutes

3.2 'Agent Paymaster' Tutorial

Objective

Create a single, shareable tutorial that demonstrates — end to end — how to build an AI agent that autonomously earns, holds, and spends USD1. This is the hero developer content: designed to be the most-referenced USD1 developer resource.

Format

- Written tutorial with embedded, copy-paste-ready code blocks
- Companion video walkthrough — screen recorded, under 12 minutes
- Live demo environment hosted at a stable URL for developers to fork

The Agent Paymaster Scenario

The tutorial should build a specific, complete example: an AI agent that provides a service (e.g., data summarization), invoices the requesting agent in USD1 via EIP-3009 pull authorization, collects payment without human confirmation, and allocates the USD1 balance according to a simple treasury policy. This scenario demonstrates every key USD1 feature in a realistic context.

> ⚙ **ENGINEERING DEPENDENCY** — Action Required from Engineering Team
>
> This tutorial is not a marketing document — it is a technical build that Marketing packages and distributes. Engineering must own the actual code implementation and review all technical claims before publication.
>
> - Build the Agent Paymaster reference implementation in the Engineering-approved stack before Marketing begins packaging
> - Ensure the EIP-3009 pull authorization is demonstrated using the live, post-audit mainnet contract — not a testnet simulation
> - Confirm the live demo environment URL and uptime SLA before Marketing publishes — the demo going down after launch is a credibility issue
> - Engineering to provide a brief technical explainer (500 words) that Marketing can adapt into the tutorial's 'How This Works' section

Distribution

- Announced as part of the broader developer guide launch
- Promoted to AI developer communities: Hugging Face forums, LangChain Discord, developer X/Twitter
- Submitted to product hunt and relevant developer showcase platforms

3.3 Agent-Only Hackathon

Objective

Host a hackathon positioned as the first open agentic economy competition — USD1 as the only permitted currency for all agent transactions within the competition. This directly mirrors Circle's hackathon strategy while staking a category claim Circle has not yet made.

Positioning

Framing: 'Build the first business that runs without humans — and gets paid in USD1.' The hackathon is not a crypto hackathon. It is an AI hackathon where USD1 is the payment infrastructure. Judge entries on: (1) genuine economic activity between agents, (2) volume and frequency of USD1 transactions, (3) commercial viability of the agent business model.

Logistics

- Target launch announcement: 30 days from today
- Target submission deadline: 45 days from today
- Prize pool: USD1-denominated (signals the product's own conviction in the currency)
- Partner with at least one major AI developer community for co-promotion
- Live judging event streamed publicly — captures ongoing content and signals the event is real

⚙ **ENGINEERING DEPENDENCY** — Action Required from Engineering Team

The hackathon requires Engineering to provision a developer sandbox environment where participants can build against USD1 infrastructure without production risk. Marketing cannot run this event without the sandbox being operational before the announcement date.

- Build and deploy a USD1 developer sandbox environment with testnet USD1, faucet access, and documentation by the announcement date
- Create a hackathon SDK starter kit — pre-configured environment that removes the setup friction for participants
- Staff at least one Engineering team member as a technical resource in the hackathon's official Discord/Slack channel for the duration of the event
- Provide automated transaction monitoring so Marketing can surface real-time stats during the live judging stream

Post-Hackathon Content

- Publish winner case studies as the first entries in the 'Agentic Economy' content series
- Convert the top 3 winning projects into developer tutorials with the teams' permission
- Use hackathon transaction volume as proof point in institutional and press outreach

Shawn Suggestion:

Most hackathon participants just pitch/play with ideas and never actually build the project after. We need to shift the focus. Our ultimate goal isn't just generating a list of concepts; it's getting the creators of the best ideas to actively integrate and adopt USD1.

Core Objectives:

- **Attract Top-Tier AI Talent:** We need to break out of our echo chamber. The goal is to attract high-quality AI builders and expand our reach far beyond the people who already know about USD1.

- **Strategic Co-Hosting for Broader Reach**: For all external marketing, WLFI should be positioned as the **lead host,** but we must partner with a recognized AI developer community or an established AI company. (Leveraging their AI audience and influence)
    - ***Why?*** WLFI already has the crypto-native developers covered. We need this partner to act as our bridge to bring in traditional, non-crypto AI developers.
- **Drive Actual Adoption**: While we will offer a standard prize pool, the real win is getting these developers to actually build with USD1.
    - Whenever we speak to developers during the online hackathon, our core message must clearly and aggressively articulate why USD1 is the absolute best stablecoin for their specific applications.
    - **Incentives**: We should roll out a **dedicated support program or grant** for any team that successfully adopts USD1 into their project. (Keep the barrier to entry reasonable)

3.4 Weekly 'Agentic Economy' Content Series

Objective

Establish USD1 as the authoritative publisher of agentic economy content — real examples, real agent transactions, real USD1 as the case study in every piece.

Content Types (Rotate Weekly)

Week Type	Content Description
'Agent in the Wild'	Document a real-world or demonstrated AI agent completing an economic transaction in USD1. Show the transaction on-chain, narrate the business logic, explain what the agent did autonomously.
'Build Log'	Behind-the-scenes of a USD1 integration. Written with the partner or developer. Technical and specific — not a press release.
'Agentic Economy Data'	USD1 on-chain metrics, transaction volumes, agent activity statistics. Positioned as the data source for agentic economy analysis.
'USD1 vs. The Alternative'	Factual, technical comparison of how USD1 handles a specific agentic use case versus USDC. Never disparaging — always demonstrating technical specificity.

Distribution Channels

- Primary publication: WLFI blog / Medium
- X/Twitter thread format for each piece — written natively for the platform
- LinkedIn long-form version for institutional and professional audience
- Farcaster for crypto-native developer audience
- Developer newsletter digest — aggregate monthly into one email

⚙ **ENGINEERING DEPENDENCY** — Action Required from Engineering Team

The 'Agentic Economy Data' content type requires Engineering to provide a reliable data feed of USD1 on-chain metrics that Marketing can access without direct database queries.

- Build a marketing-accessible analytics dashboard or API endpoint that surfaces: daily/weekly transaction volume, number of unique agent wallets, chain-by-chain breakdown, average transaction size
- Confirm data is refreshed at least daily and accessible to Marketing without Engineering involvement for each pull
- Provide guidance on which on-chain metrics are meaningful and which could be misleading — Marketing will not characterize metrics Engineering has not approved

3.5 'Agent Treasury' Open-Source Smart Contract

Objective

Build and open-source a reference implementation smart contract showing how an AI agent holds and manages a USD1 balance — including spend policies, authorization controls, and treasury allocation logic.

Why This Matters for Marketing

Open-source reference implementations are the highest-credibility developer content that exists. They are cited, forked, and built upon. They live in GitHub repositories where developer decisions are made. The Agent Treasury contract is not a marketing artifact — it is an infrastructure artifact that Marketing packages, announces, and distributes. It demonstrates USD1's thesis with code, not words.

⚙ **ENGINEERING DEPENDENCY** — Action Required from Engineering Team

This initiative is Engineering-led. Marketing's role is packaging, announcement, and distribution — not code authorship. Marketing should not announce or promote this initiative until Engineering confirms the contract is audited and production-ready.

- Design and implement the Agent Treasury reference contract with production-quality code, full documentation, and a comprehensive test suite
- Complete a third-party security review before open-source release — Marketing will not announce an unreviewed smart contract
- Publish to GitHub with an MIT or equivalent open-source license
- Provide Marketing with a technical brief (750 words) explaining what the contract does, the design decisions made, and why those decisions matter for agentic developers
- Make a senior engineer available for a 30-minute recorded technical walkthrough that Marketing can publish as companion content

Marketing Execution (Post-Engineering Delivery)

- Launch blog post: 'Introducing Agent Treasury — the first open-source USD1 balance management implementation'
- GitHub README written for both human and LLM readers
- Thread breakdown of the contract design for X/Twitter and Farcaster developer audiences
- Submit to DeFi developer directories and agent framework documentation pages

Community and developer relations (DEVREL)

The original playbook publishes AT developers. This section is about building WITH them

- Create a USD1 developer Telegram or Discord channel
- Post hackathon announcement there first (exclusive early access builds community).

- Identify 5-10 agentic AI developers already building with stablecoins, DM them personally
- Hackathon creates the first cohort of USD1 developers. Nurture them post-hackathon.
- Monthly "office hours" AMA in the developer channel (30 min, Shawn + eng rep)
- Feature hackathon winners and early adopters in content series
- Developer advocates emerge organically from hackathon winners and early adopters
- Stanford summit brings a second cohort of developer relationships
- Consider a "USD1 Developer Program" with early access, co-marketing, and direct eng support

4 Institutional Thought Leadership (5.3)

The developer content track owns the narrative in builder communities. The institutional thought leadership track owns the narrative in the rooms where capital allocation, regulatory approval, and platform adoption decisions are made. Both tracks must run simultaneously and must tell the same underlying story from different angles.

4.1 Independent Economic Study: 'The Scale of the Agentic Economy by 2030'

Objective

Commission and publish independent third-party research establishing the market size narrative that justifies USD1's positioning. This is not a WLFI white paper — it must be authored by a credible, independent economic research firm to carry institutional weight.

What the Study Must Establish

- Total addressable market for agentic payments by 2030 — denominated in transaction volume and dollar settlement value
- Current trajectory based on measurable leading indicators (agent platform growth rates, AI API transaction volumes, agentic coding environment adoption)
- The stablecoin settlement layer opportunity — why agentic economic activity requires programmable, machine-readable currency
- USD1's positioning within that opportunity — this is the one section WLFI contributes framing to, while the research firm authors the analysis

Execution

- Identify and engage research firm within 30 days (target: Bernstein, Chainalysis Research, Messari, or equivalent institutional-grade crypto research firm)
- Draft terms of reference and scope of work — Marketing leads, Legal reviews
- Target publication date: 120 days from today
- Distribution: simultaneously to financial media, institutional investor lists, and as a downloadable resource on WLFI properties

How to Use the Study

The study becomes a multi-use asset. Every institutional meeting, every OCC submission, every G42 partnership discussion, every press inquiry about USD1's long-term position should be accompanied by or reference this research. It provides the third-party validation that converts WLFI's internal conviction into an externally credible market thesis.

4.2 WLFI White Paper: 'USD1 as Critical Infrastructure for the Agentic Economy'

Objective

Publish a formal WLFI white paper written for sovereign wealth funds, central banks, and institutional investors — not for general market or press consumption. This is a long-form, technically specific document that establishes USD1's institutional credentials.

Audience & Tone

Assume the reader is: a sovereign wealth fund CIO, a central bank digital currency working group lead, or an institutional treasury manager. They are skeptical of crypto marketing. They have read Circle's and Tether's institutional materials. They have compliance and legal teams that will review whatever WLFI publishes. Write accordingly — factual, specific, no superlatives that cannot be backed by cited data.

Required Sections

- USD1 Architecture Overview: multi-chain deployment, real-time proof of reserves, EIP-3009 implementation
- Reserve Composition and Management: current composition, Big Four attestation schedule, reserve policy
- Regulatory Status: OCC filing, MiCA in-process, GENIUS Act compliance framework
- Agentic Economy Use Cases: three institutional-grade case studies of agent payment settlement
- Risk Framework: what WLFI has done to address each category of institutional risk concern
- Appendix: Technical specifications, compliance documentation index, contact information for institutional inquiries

⚙ **ENGINEERING DEPENDENCY** — Action Required from Engineering Team

The white paper's technical sections — architecture, reserve proof, EIP-3009 implementation — require Engineering review and sign-off before publication. A factual error in an institutional white paper is a credibility-ending event.

- Review and approve all technical claims in the Architecture Overview section before Marketing finalizes the document
- Provide a current, accurate diagram of USD1's multi-chain deployment architecture for inclusion
- Confirm the real-time proof of reserves API endpoint and verify it will be stable and maintained at the URL cited in the paper
- Provide a technical summary of EIP-3009 implementation — what was done, why it matters, what it enables — for Marketing to adapt into institutional language

Timeline

- First draft: 60 days from today
- Legal and Engineering review: 75 days
- Publication: 90 days from today
- Simultaneous distribution to WLFI institutional contact list, sovereign wealth fund relationships, and relevant regulatory contacts

4.3 Executive Keynote & Speaking Strategy

Objective

Position Zak and WLFI leadership as the definitive voices on the intersection of stablecoins and the agentic economy. Speaking engagements at key events are the highest-density channel for reaching institutional and developer decision-makers simultaneously.

Priority Events

Event	Audience & Strategic Purpose
Consensus (CoinDesk)	Crypto and institutional audience — establish USD1's agentic narrative with the mainstream crypto press and institutional attendees
Token2049	Global institutional and developer audience — reinforce USD1's market position with a data-led keynote on agentic payments growth
G42 / Sovereign AI Events	Sovereign wealth funds, government technology leaders, G42 portfolio — must be coordinated with G42 directly; Marketing facilitates, not leads
Anthropic / AI Lab Events	Developer-first audience — technical keynote positioning USD1 as the payment layer for agent-to-agent economies
Money 20/20	Financial institution audience — institutional track keynote on GENIUS Act, OCC status, and USD1 as enterprise stablecoin infrastructure

Keynote Content Principles

- Lead with the market data, not with USD1 — establish the agentic economy opportunity first, then position USD1 as the infrastructure answer
- Every keynote must include at least one live demo or on-screen demonstration of USD1 technical capability — not slides about features
- Q&A preparation: anticipate the 'political association' question and the 'USDC comparison' question — both need rehearsed, factual, non-defensive answers
- Post-keynote: publish the full slide deck, transcript, and a written summary within 48 hours — keynote content has a second life as digital distribution

Note on event strategy

- Token2049 is more institutional/VC events. They serve the white paper distribution and sovereign/institutional narrative. Most developers don't really go to Token2049
    - If we want a developer-facing keynote or presence, the right event is **Devcon 2026 (India)** — Ethereum Foundation's flagship developer conference. This is where the EIP authors, framework maintainers, and agent infrastructure builders actually show up. An ERC-8183 contribution or our own EIP would land 10x harder at Devcon than at Token2049.
- **Stanford Events (Stablecoin Summit / AI and the Future of Money) (July 2026)**
    - **Day 1: Hoover Institution x WLFI (Stanford campus) — policy day. This is where the power players go**. Hoover is a conservative think tank that's hosted sitting presidents and prime ministers. Their published focus includes "understanding the effects of technology on economics and governance" — we don't need to force the fit.
        - Topics: stablecoin policy under GENIUS Act, AI agent payment regulation, the future of money as infrastructure.
        - Target speakers (need help from exec): David Sacks, Peter Thiel, Sandy from Franklin Templeton, possibly Condoleezza Rice via Hoover connections. This day is institutional and political. No crypto-native vibes
        - Will need help from Execs to open the connection with Hoover (need to get in contact with Condoleezza Rice to open the discussion for this event, we need Hoover’s official invitation to do the event)

- **Berkeley — Day 2 builder day. AI engineers, researchers, framework developers, crypto builders. No politics**
    - Topics: AI agent architecture, agent payment infrastructure, USD1 technical deep-dive. live demo moment for Agent Treasury or agent skills etc.

4.4 'Fastest-Growing Stablecoin in History' Press Narrative

Objective

USD1 reaching $4.5B in under 12 months versus Circle's 3.5 years to $2B is one of the most powerful growth narratives in financial technology. This story should not be discovered by journalists — it should be told by WLFI, with the framing WLFI controls.

Execution

- Build a dedicated data story: 'USD1 Growth vs. Stablecoin History' — a visual, citable comparison that WLFI publishes and updates as milestones are reached
- Develop a press kit specifically for this narrative: growth chart, milestone timeline, key statistics, executive quotes
- Identify and brief 3-5 tier-1 financial media contacts before milestone announcements — do not let other outlets frame the story first
- Milestone trigger system: pre-draft press outreach templates for $5B, $7.5B, $10B, and every $5B increment thereafter — announcements should be immediate, not reactive

⚙ **ENGINEERING DEPENDENCY** — Action Required from Engineering Team

The growth narrative requires real-time access to accurate market cap data. Marketing must not cite USD1 market cap figures without Engineering-verified data.

- Provide Marketing with a verified, regularly updated data feed for USD1 market cap, total supply, and chain-by-chain distribution
- Confirm the authoritative source for USD1 market cap that will be cited in all press materials — agree on one source and maintain it
- Alert Marketing within 24 hours of any significant market cap milestone crossing (every $500M increment) so press outreach can be activated

4.5 AI Visibility & Generative Engine Optimization (GEO)

Objective

USD1 is a strong product in a competitive market. The problem isn't the stablecoin — it's visibility.

Make USD1 the default answer when anyone asks ChatGPT, Perplexity, Gemini, Claude, or Grok "what are the top stablecoins?" Right now, USD1 doesn't show up. USDC, USDT, DAI, and etc all get cited.

USD1 seldom show up, because AI recommends what it has seen mentioned enough times across sources it trusts. GEO fixes this.

note: OpenAI has launched ChatGPT Atlas, a new AI-driven browser. While its current adoption rate is low, it signals a major upcoming shift in user behavior, where people will increasingly rely on AI to navigate the web rather than using traditional search engines like Google.

GEO (also known as LLM Optimization / LLMO) is an additional layer on top of traditional SEO. AI systems don't just link to you — they read your content and decide whether to quote or recommend you directly in their answers. For a stablecoin pursuing global adoption, this layer is no longer optional.

Why Now

USD1 is moving into agentic payments and AI-integrated finance. If AI systems don't already know who USD1 is before that work goes live, they can't recommend it — not to users, and not when operating as agents. Being visible to AI isn't just a marketing play. It's infrastructure. And getting there after the fact is significantly harder.

USD1 Current AI Standing

Metric	Value
Overall AI Visibility Score	34 / 100 — Low
Mentions	1,600
Citations	89
Cited Pages	93

Mentions *: reflect how often USD1 comes up in AI-generated responses.*

Citations *: track how many of those responses go a step further and reference WLFI's site as a source.*

Cited Pages *: tells us how many individual pages on WLFI's domain are actually being pulled into AI answers.*

USD1 is being talked about more than it's being quoted — AI systems are encountering the brand but not yet treating it as an authoritative source worth citing directly. That's the exact problem GEO solves

Preliminary Website Audit

Metric	Result
Overall Score	78 / 100
Pages Audited	14
Critical Issues	0
Total Issues	69

Top priority fixes: Mismatched canonical URL (1 page), missing viewport meta (2 pages), 10 orphan pages with no internal links (invisible to AI crawlers). Meta tags across key pages should lead with USD1 as the core product. Content is not yet structured for AI extraction and quotation.

Key insight: Every major stablecoin issuer (Circle, Tether, Ethena) builds their website narrative around the stablecoin as the core product. WLFI's site buries USD1 as one feature among many. AI picks up on this. Fix: Lead homepage with ex: **"World Liberty Financial: xxxxx, Powered by USD1."**

> ***GEO is the process of ensuring that AI systems have encountered USD1 enough times, across enough credible sources, that they have a clear and accurate understanding of what it is, what it stands for, and how it works. Think of it less as marketing and more as alignment; making sure that as USD1 steps further into the AI world, the AI world is already familiar with USD1.***
>
> ***This connects directly to the agentic payments future. If AI systems don't think about USD1 when answering questions, they can't recommend it, not to users, and not when operating as agents.***

Competitive Benchmark: USD1 vs USDC

Metric	USD1	USDC
Related Topics AI Volume	9,900	196,000
Brands Mentioned alongside	76	522
Source Domains citing	131	781

USDC is being discussed in AI conversations 20x larger in volume, mentioned alongside 6x more brands, and referenced across 6x more domains. The top sources currently contributing to USD1's presence — Yahoo, YouTube, and Forbes; show that coverage exists, but it needs to be deepened into the crypto-native publications, which has been identified as the highest-weight sources for stablecoin queries across AI platforms.

Regional GEO / SEO

China: Chinese LLMs draw USD1 content from three source categories:

- **CEX exchanges (Binance, OKX, Bybit, Bitget, MEXC, Gate and etc):**
  - A significant share of existing Chinese-language USD1 content comes from exchange platforms like Bitget, MEXC, and Gate, through their research articles, project introductions, listing announcements, and market updates. These are already indexed by Chinese AI systems and form the current base of USD1's CN presence.
- **Market data platforms (CoinGlass, CMC, CoinGecko): discoverable but incomplete**
  - CoinGlass, CoinMarketCap, and CoinGecko are widely referenced across the CN crypto industry and are frequently cited by Chinese AI systems. USD1's data pages on these platforms are discoverable, but need to be complete and fully optimized to carry maximum weight.
- **CN crypto media (PANews, Blockbeats, TechFlow): thinnest layer, highest leverage.**
  - Outlets like PANews, Blockbeats, and TechFlow provide the deepest narrative coverage , project background, ecosystem developments, market positioning. This editorial layer is what gives AI systems the semantic richness they need to describe USD1 accurately and confidently. It's also currently the thinnest part of USD1's CN presence and the highest-leverage area to develop.

- Overall CN AI visibility is supported but shallow.

Korea: XDO is already running SEO with results.

- In February, USD1 recorded the highest stablecoin search growth on Naver at +158% (310→800), outpacing USDC (+37%), USDe (+54%), and DAI (-2%).
-

Stablecoin	January	February	Change
USD1	310	800	**+158%**
USDe	260	400	+54%
USDC	3,310	4,550	+37%
DAI	490	480	-2%

- USD1 had one of the lowest starting volume of the group and still grew the fastest. This is SEO compounding in action: with continued optimization, USD1's presence across Korean internet platforms is expected to strengthen month over month.
- Next phase: add a GEO layer targeting Naver CLOVA X and other Korean AI platforms, deepen Naver Blog/Cafe presence, increase coverage in Korean crypto media (Tokenpost, BlockMedia Korea, Coinreaders).

XDO AI Marketing OS Supports

- XDO's AI team is building GEO into their Marketing OS as an ongoing capability, they will help assist the execution: content, outreach, technical optimization, and community.

Execution Phase

Phase 1 (Days 0-30): Fix technical foundations, repositioning USD1 as core narrative on website, ensure AI crawler access, add structured data, create standalone "What is USD1?" page.

Phase 2 (Days 30-90): Build authority, secure media coverage in crypto-native publications AI trusts most, complete all data platform listings (CoinGecko, CMC, DeFiLlama), launch comparison content, pursue community presence on Reddit and X, get USD1 featured on YouTube, aim for Wikipedia entry.

Phase 3 (Days 90-180): Scale content engine, ongoing AI-optimized articles in EN/CN/KR, monthly competitor benchmarking against USDC visibility scores, agentic payment content positioning USD1 in the AI payments narrative.

Multi-language execution: English GEO (ChatGPT, Perplexity, Gemini, Google AI Overview, Grok), Chinese GEO (Simplified + Traditional Chinese, parallel track), Korean SEO+GEO (GEO structure layer on existing Korean content).

⚙ **ENGINEERING DEPENDENCY** — Action Required from Engineering Team

Phase 1 website fixes require Engineering support:

- Fix mismatched canonical URL (1 page)
- Fix missing viewport meta (2 pages)
- Link 10 orphan pages into site navigation

- Rewrite meta tags to lead with USD1 as core product
- Create a standalone "What is USD1?" page with structured data (JSON-LD schema)
- Ensure AI crawlers (GPTBot, Google-Extended, ClaudeBot, PerplexityBot) have full access via robots.txt

5 Execution Roadmap

Phase 1: Foundation (Days 0–30)

The first 30 days establish the narrative infrastructure that everything else builds on. These are not 'nice to have' — they are the load-bearing deliverables.

Initiative	Owner	Day	Eng. Required?
Finalize core narrative framework + language standards	shawn	1-7	No
Begin Developer Guide structure + outline (framing, section structure, narrative — no code yet)	shawn	7-14	No (eng code samples needed later)
Publish positioning post: "USD1: The Agentic Economy's Financial Primitive"	shawn	14	No, Compliance review (internal, not eng)
Launch "Agentic Economy" bi-weekly data series first edition uses live PoR API	shawn	14	**Yes (dashboard API access — security + eng confirm endpoints)**
Data analytics dashboard to assist for marketing	shawn	14	**Partly Yes (Security: secure read-only API access (auth tokens, IP whitelist). Eng: confirm which endpoints have the data (expose tx volume, agent wallets, chain breakdown, growth rate and etc).)**
Begin online hackathon planning — prize pool, judging criteria, partner co-promoters.	shawn	7-14	No
Brief 3-5 tier-1 media contacts on USD1 growth narrative — off the record, relationship-building	Shawn / Wachsman ?	14-30	No
Identify + engage economic research firm for "Agentic Economy by 2030" study	Shawn	14-30	No
Begin white paper outline + engage Legal for review process	Shawn + Legal	21	No
Announce hackathon with full details — eng sandbox must be ready before this date	Shawn	Day 30 (or Day 37 if sandbox not ready)	**Yes (Developer guide, code samples, SDK/sandbox readiness (eng) — can prep everything but can't announce until sandbox confirmed)**

Phase 2: Execution (Days 30–90)

Phase 2 converts the narrative foundation into deployed content assets and market coverage. Each deliverable in this phase depends on the Phase 1 foundation being in place.

Simultaneous developer guide co-authorship with engineering. This requires eng to deliver first; I package second. see phase 2 - Lots of deliverables on day 45, might have some delay running in parallel.

Initiative	Marketing Owner	Days	Eng. Required?
Publish 'Building Agentic Businesses with USD1' Developer Guide — full, co-authored with Engineering	Shawn + Eng	45	**Yes (code samples, API reference, quickstart validation)**
Publish Agent Paymaster tutorial — eng builds reference implementation, Shawn packages + distributes	Shawn + Eng	45	**Yes (reference implementation, live demo URL)**
Run hackathon — active competition period, Engineering staffed in support channel	Shawn + Eng	30-45	**Yes**
Package + publish USD1 Agentic Payment Specification — eng authors, Shawn packages + distributes	Shawn + Eng	45	**Yes (eng authors the spec)**
Publish USDC growth comparison data story	Shawn + Eng	45	**Yes (verified market cap data feed)**
File speaker submissions for Token2049, Money 20/20	Shawn	52	No
Publish hackathon winners + case studies	Shawn	52	No
Prep Agent Treasury announcement materials. Hold for eng audit completion	Shawn	55-60 (publish when audit confirmed)	**Yes (audited contract, technical brief from eng)**
Submit white paper first draft to Legal + Engineering review	Shawn	60	**Yes (technical sections review)**
"Agentic Economy" series — 4 editions in Phase 2	Shawn	30-90	**Yes (dashboard data feed)**
Consensus Miami execution — Shell Bay golf, main stage, press briefings, First keynote delivered	Shawn + Execs	60-75	No

Consensus Miami Plan

Shell Bay golf event (Monday May 4)

- 40-50 handpicked attendees. VIP crypto + TradFi.

- Eric Trump as host. Sandy from Franklin Templeton as speaker.
- Barter: Shell Bay access + Eric as conference closer = main stage equivalent or better branding package from Consensus.

Day 1 main stage (Tuesday May 5)

- Zak keynote or panel. Tentative Frame: "The agentic economy needs compliant infrastructure. Here's what that looks like."
- If a major announcement is available (Cyfrin, new chain deployment, OCC update), anchor the session around it.
- Post-keynote: publish full slide deck, transcript, summary blog post within 48h.

Phase 3: Amplification (Days 90–180)

Phase 3 converts content assets into compounding market presence — white paper distribution, press milestone execution, and ongoing content volume.

Initiative	Marketing Owner	Days	Eng. Required?
Publish WLFI white paper: 'USD1 as Critical Infrastructure for the Agentic Economy'	Shawn	90	**Yes (technical sections signed off)**
Distribute white paper to institutional contact list, sovereign wealth fund relationships	PR + BD	90	No
Economic study published — press release, media briefings, institutional channels	Shawn	120	No
Developer Guide V2 — updated with hackathon learnings, new chain deployments, New EIP created or supported?	Shawn + Eng	120	**Yes (tech updates, new code samples)**
"Agentic Economy" series — 12+ editions by Day 180	Shawn	Ongoing	**Yes (dashboard data feed)**
Press milestone execution for each $500M market cap increment	PR	Triggered	**Yes (market cap data feed + milestone alerts)**
2nd, 3rd, 4th keynote appearances — Token2049 + Stanford stablecoin summit (AI and the future of money) + G42/sovereign event	Shawn + Execs	90-150	No

6 Engineering Dependency Summary

This section consolidates all Engineering dependencies identified throughout the document. Marketing should share this section with Engineering leadership to establish coordination protocols and agreed hand-off timelines. No deliverable marked 'Eng. Required' should be published or announced until the Engineering dependency is confirmed as complete.

Coordination Protocol
Marketing to initiate a formal kick-off with Engineering for each dependency item at least 2 weeks before the Marketing publication target date. Engineering should confirm (a) feasibility, (b) estimated delivery date, and (c) the specific deliverable format Marketing will receive. Marketing publication dates are contingent on these confirmations.

Engineering Deliverable	Required For (Marketing Initiative)
Code review and validation of all Developer Guide examples	Section 3.1 — Developer Guide
Headless wallet creation quickstart validation against live SDK	Section 3.1 — Developer Guide
Agent workflow code samples (3 types: agent-to-agent, fee settlement, payroll)	Section 3.1 & 3.2
API reference in machine-readable format (OpenAPI spec)	Section 3.1 — Developer Guide
Agent Paymaster reference implementation (code, tested, production-ready)	Section 3.2 — Agent Paymaster Tutorial
Live demo environment URL and uptime SLA confirmation	Section 3.2 — Agent Paymaster Tutorial
Developer sandbox environment for hackathon participants	Section 3.3 — Hackathon
Hackathon SDK starter kit	Section 3.3 — Hackathon
Engineering support staffing in hackathon Discord/Slack	Section 3.3 — Hackathon
Marketing-accessible analytics dashboard (transaction volume, agent wallets, chain breakdown)	Section 3.4 — Weekly Content Series
Agent Treasury contract — audited, open-source, with technical brief	Section 3.5 — Agent Treasury

Technical architecture review of white paper sections	Section 4.2 — White Paper
Real-time proof of reserves API stable endpoint confirmation	Section 4.2 — White Paper
Verified USD1 market cap data feed and milestone alert system	Section 4.4 — Press Narrative
On-chain metrics for USD1 growth data story	Section 4.4 — Press Narrative

Engineering Dependency Tracker (Revised for reference)

Phase 1 marketing

Eng deliverable	Status
Proof of reserves API confirmed stable	possibly POR page is enough https://por.worldlibertyfinancial.com/ **Caveat:** It's not PoR against cash reserves (treasury holdings). It's on-chain supply aggregation. Fine for marketing data series. NOT sufficient for "machine-readable reserves" claim in institutional white paper, that needs the actual reserve composition (T-bills, cash, etc.)
ERC-8183 evaluation	Engineering evaluates whether to adopt or propose alternatives. Marketing needs to know the outcome before writing developer docs.
x402 facilitator	In progress (eng)
Hackathon SDK, Sandbox readiness	Developer guide, code samples, SDK/sandbox readiness (eng) — can prep everything but can't announce until sandbox confirmed
Cyfrin own openclaw?	added after call with eng yesterday, if partnership deal done, Marketing announces and promotes.

Phase 2 marketing

Eng deliverable	What marketing can't do without it	Status
Developer sandbox + SDK starter kit	Hackathon launch. Cannot announce hackathon without a working sandbox. Devs show up and can't build	Not started (eng)
Hackathon SDK starter kit	Pre-configured environment that removes setup friction for participants. Ships alongside sandbox	Not started (eng)

Eng support staffing in hackathon Discord	Developers will ask technical questions Shawn can't answer. Need at least 1 eng rep for the duration of the hackathon	Not discussed
Developer guide (Agent workflow) code samples (agent-to-agent, fee settlement, payroll)	Developer Guide code blocks. Shawn writes structure/narrative/framing, eng fills these in. Cannot publish guide with untested code	Not started (eng)
Code review + validation of Developer Guide	Separate from writing the code samples — eng reviews the FULL guide for technical accuracy before publication.	After eng delivers code samples
Headless wallet creation quickstart validation against live SDK	The "get started in 15 minutes" quickstart must actually work end-to-end. Eng runs through it once and confirms.	Not started (eng)
Agent Paymaster reference implementation (code, tested, production-ready)	The tutorial is a marketing package of this code. Eng builds it, Shawn wraps it for distribution. Cannot start packaging until this exists.	Not started (eng)
Cyfrin framework integration	Co-marketing announcement blocked until eng confirms integration is complete	Friday call
USD1 Agentic Payment Specification (eng authors)	Marketing packages and distributes at Day 45. Cannot package until eng delivers the spec content.	Not started (eng)

Phase 3 marketing

Eng deliverable	**What marketing can't do without it**	**Status**
Agent Treasury contract (audited, open-source)	Announcement + dev content. Cannot announce until third-party audit is complete	Not started (eng)
Agent Treasury technical brief	Shawn adapts into announcement blog post, X thread, GitHub README. Explains what the contract does, design decisions, and why they matter for agent developers.	After contract ships
Engineer 30-min recorded walkthrough of Agent Treasury	Marketing publishes as companion video content alongside the announcement.	After contract ships
White paper technical sections reviewed	White paper's technical sections (architecture, reserve proof, EIP-3009) need eng sign-off before publication.	After draft (Day 60)
Developer Guide V2 tech updates	Updated code samples reflecting new chain deployments, new created or supported EIPs, hackathon learnings, Cyfrin	After Phase 2

7 Success Metrics & KPIs

The following KPIs define success for Pillar 5. These are directly derived from the targets in the master USD1 Strategic Dominance Roadmap and are owned by Marketing. Metrics requiring Engineering data infrastructure are flagged — Marketing should confirm data availability before committing to a reporting cadence.

7.1 Developer Mindshare Metrics

Metric	Target	Timeline	Notes
Developer Guide unique sessions	**1,000 / month**	30 days post-launch	Track via developer portal analytics
Time-to-first-integration (SDK)	**< 20 minutes median**	60 days	Requires SDK analytics from Engineering
Hackathon registrations	**200+**	Submission deadline	Track via registration form
Hackathon USD1 transaction volume	**Meaningful on-chain activity**	End of competition	Requires Engineering transaction monitoring
GitHub stars — Agent Treasury repo	**500+**	90 days post-launch	Track via GitHub API
Developer guide cited externally	**5+ citations in 60 days**	60 days post-launch	Track via brand monitoring tool
Weekly content series — avg. impressions	**5,000+ per piece**	Ongoing	Track via platform analytics

7.2 Institutional & Press Metrics

Metric	Target	Timeline	Notes
White paper downloads / requests	**100+ institutional recipients**	90 days post-publication	Track via gated download or direct outreach log
Tier-1 media placements on growth narrative	**3+ pieces in 90 days**	90 days	Track via PR monitoring
Keynote speaking slots confirmed	**2 tier-1 events**	90 days	Events lead tracks
Economic study citations in press	**5+ references in 60 days post-publish**	Day 180	PR monitoring

Institutional inquiries inbound (white paper)	**20+ from qualified institutions**	Day 120	BD tracks and reports to Marketing

7.3 Narrative Penetration Metrics

Metric	Target	Timeline	Notes
'Agentic economy' + USD1 mentions (unpaid)	**50+ per month**	Day 90	Brand monitoring tool
USD1 cited as 'agentic stablecoin' in external content	**10+ unpaid references**	Day 90	Brand monitoring
Developer survey: USD1 unaided awareness in agentic dev community	**Establish baseline, target 20%+ in 90 days**	Day 90	Requires survey execution

8 Feedback, Review & Alignment

This document is issued for Marketing team review and feedback before it is adopted as the execution roadmap. The following process governs the review cycle.

Review Stage	Details
Marketing team review	Marketing team reviews this document in full. Feedback submitted within 7 days. Focus: feasibility of timelines, resource requirements, missing initiatives, and clarity of Engineering dependency protocol.
Engineering coordination review	Section 6 (Engineering Dependency Summary) shared with Engineering leadership. Engineering confirms: which dependencies are feasible, estimated delivery dates, and any constraints Marketing should know before committing to timelines.
Leadership alignment	Revised document reviewed by Zak and relevant leadership to confirm alignment with master Strategic Roadmap. No substantive strategic changes after this point — only tactical refinements.
Final version adopted	Once leadership signs off, this document becomes the Marketing team's execution roadmap. Timelines become commitments. Engineering dependencies become tracked deliverables.

Feedback Focus Areas for Marketing Team

1. Are the timelines in Section 5 achievable with current Marketing team capacity? If not, identify the specific resource constraint (headcount, budget, external vendor dependency).
2. Are there Pillar 5 initiatives in the master roadmap that are not represented here and should be added?
3. Does the Engineering Dependency Summary in Section 6 accurately capture all cases where Marketing will need Engineering input? Are there additional dependencies not flagged?
4. Are the KPIs in Section 7 the right measures of success, or are there metrics the Marketing team would prefer to own?

All feedback should be directed to Zak or the designated document owner. Revisions will be incorporated and the updated version distributed to the full review group before final adoption.
